

1. Artificial Intelligence is the simulation of human intelligence in machines that are programmed to think and learn.
2. Machine Learning is a branch of Artificial Intelligence that enables computers to learn from data without explicit programming.
3. Cloud Computing is the delivery of computing services such as storage, servers, databases, networking, and software over the internet.
4. Cyber Security is the practice of protecting systems, networks, and data from digital attacks and unauthorized access.
5. A database is an organized collection of related data that can be stored, managed, and accessed efficiently.
6. Artificial Intelligence improves efficiency, reduces human effort, increases accuracy, and supports better decision-making. It is widely used in healthcare, education, finance, transportation, and customer service.
7. Cloud Computing provides services such as online storage, web hosting, software applications, data backup, and remote collaboration. It offers scalability, flexibility, and cost-effectiveness for individuals and organizations.
8. Cyber Security protects sensitive information from unauthorized access and cyber threats. It helps maintain privacy, ensures data integrity, improves system reliability, and safeguards digital resources.
9. Machine Learning is a subset of Artificial Intelligence that enables computers to learn from data and improve their performance without being explicitly programmed. It uses algorithms and statistical models to identify patterns, make predictions, and support decision-making. Machine Learning can be classified into supervised learning, unsupervised learning, and reinforcement learning. It is widely used in recommendation systems, fraud detection, image recognition, speech recognition, medical diagnosis, and autonomous vehicles. By analyzing large volumes of data, Machine Learning helps organizations improve efficiency, accuracy, and innovation across various fields.
